

The Context Sheet

Everything that loads before you type, and how to get the room back.

LOOK AT A REAL SESSION

Not a fresh one. Work for a few minutes first, then run

```
/context
```

The most useful command here, and almost nobody runs it. Write down the largest item. That number is the whole point.

Then let it read its own report

Run `/context` and look at the result.

1. What is taking the most room?
2. Of that, what is not being used in what I am doing today?
3. What one change would free the most, and what would I lose?

THE FOUR THINGS TAKING UP ROOM

WHAT	LOADED WHEN	HOW TO SHRINK IT
Connected tools	Always, used or not	Disconnect what you do not use
Rules files	Every session	Split them by path
Memory index	Every session	Delete stale notes with <code>/memory</code>
Files read	As the session goes	<code>/compact</code> or <code>/clear</code>

COMPACT AND CLEAR ARE NOT THE SAME

	<code>/COMPACT</code>	<code>/CLEAR</code>
Does	Summarises the conversation	Starts fresh
You keep	The gist of what happened	Nothing
Use when	Same job, running long	New job, unrelated

WHAT TO LOOK FOR

Anything you did not expect. Anything large. And especially any connected tool you have not used this week, because what a tool can do is loaded whether you use it or not.

THE HABIT WORTH MORE THAN ANY SETTING

- Long session, still the same job, running out of room: `/compact`.
- Moving to something unrelated: `/clear`.
- **Remove exactly one thing today.** Whatever came top. Then run `/context` again and watch the number move. Seeing it move is what makes this stick.
