

The Saved Jobs Sheet

Which job to save first, and why it is not the one you would guess.

SCORE YOURS. BOTH OUT OF FIVE, THEN MULTIPLY

JOB	OFTEN	ANNOYING	SCORE
Weekly client update	5	4	20
Explaining a bug to a colleague	4	3	12
Setting up a new project	1	5	5

THE TRAP

The impressive one is nearly always the rare one. Setting up a new project is deeply annoying and still scores 5, because you do it three times a year. Build the boring twenty first.

THE SKELETON

.claude/skills/weekly-report/SKILL.md

```
---
description: When to use this, in one line. This is
  what decides whether it gets picked up at all.
---

You are a [who]. You produce [exactly what comes out].

Never [the thing you keep correcting].
Stop when [the line you must not cross].
```

Invoked by name, or picked up automatically from the description. The body only loads when it is actually used.

WHAT MAKES ONE YOU KEEP

PROPERTY	WHAT IT MEANS
Same shape every time	The steps do not change, only the input does
You can tell if it worked	There is an output you can look at and judge
It says what not to do	The failure you keep correcting is written down

SAY WHAT NOT TO DO

- This one line separates a saved job you keep from one you abandon.
- **Weak:** be accurate, be thorough, be professional.
- **Strong:** do not invent progress. If a client has nothing, say so plainly.
- Whatever it gets wrong twice, write down. That does more than any amount of describing the good version.

RANK TEN OF THEM

List ten things you did more than once last month, then ask

For each, score how often out of 5, and how annoying out of 5. Multiply. Sort by total.

Then tell me which three are worth saving, and which I should not bother with. Be blunt about the ones that are not worth it.

BUILD ONE, NOT THREE

Build the top one, use it for a week, and fix the file every time it is not quite right. A saved job you have corrected three times is worth more than three you have never run.
