

The Manager Pack

For whoever has to approve this. The answers on paper, before they ask.

WHAT A ROLLOUT ACTUALLY INVOLVES

- **One person, not a team.** They do days 1 to 10, which is under three hours spread across two weeks.
- **One real job, not a demo.** The boring weekly one, never the impressive rare one.
- **A written rules file, corrected as you go.** Written once and never touched is the same as not having one.
- **One guard, tested by breaking it on purpose.** Until something is blocked, nothing is protected.
- **Then the second person copies the first.** They have a working example to point at, which is the whole reason for going one at a time.

WHAT GOOD LOOKS LIKE IN MONTH ONE

BY	YOU SHOULD SEE
Week 1	One person installed, one real question answered on real files
Week 2	A rules file that has been corrected at least twice
Week 3	One guard that has actually blocked something
Week 4	One saved job used more than twice, by choice

THE ONE DECISION THAT DECIDES THIS

Who goes first, and on what job. Pick the person who already automates things for themselves, and the job they complain about every week. Everything else is detail.

WHAT AN APPROVER WILL ASK

What does everyone need?

A paid Claude account. A free Claude.ai account does not include Claude Code. Which plan suits you is on our site rather than printed here, so it cannot go out of date in this file.

Can we stop it touching things?

Yes, and this is the answer that matters. A written rule is guidance and is usually followed. A guard is enforcement and always runs. Anything that truly must not happen goes in a guard.

What if the person who set it up leaves?

The whole setup is plain files that live with the project. It is handed over by copying a folder, not by copying a person.

How do we know it is working?

One job that used to take a person an hour now takes a command. If nobody can point at that job by week four, it is not working, and no amount of enthusiasm changes it.

THE THREE WAYS TEAM ROLLOUTS GO WRONG

- **Everyone at once.** Nobody has a working example to copy, so ten people each solve the same first problem badly.
- **The impressive pilot.** A rare showy task instead of the boring weekly one. It demos well and changes nothing.
- **Rules with no enforcement.** A document everyone agreed to and nothing that blocks. The first accident is what teaches the lesson.

WHAT TO MEASURE, AND WHAT TO IGNORE

MEASURE	IGNORE
One named job that went from hours to a command	How many people installed it
How many times the rules file has been corrected	How long the rules file is
Whether a guard has blocked something real	How many guards exist
Saved jobs used more than twice	Saved jobs built
